Enhanced Recovery After Surgery (ERAS) for

Gynecologic Oncology Surgery

Please bring this booklet with you to all your appointments and to the hospital when you come in for surgery.
Pre-op Information at a Glance

Your Surgeon is: ________________________________

Office number: ________________________________

Your surgery date is: __________________________

If you have a cold, fever, cough or have any new sickness before your surgery, please call your surgeon’s office as soon as possible. Also call if you become pregnant.

Your planned surgery is: ________________________________

Check in time is: ________________________________

One business day before your surgery date, your surgeon’s office calls you to give you your check-in time. If you have not heard from the office by 2:00 PM, please contact the surgeon’s office.

Item(s) with a tick box is/are some of the key areas that your surgeon and care team want you to focus on before surgery. For more information, please refer to this booklet on page 9.

**Introduction**

You are going to have gynecologic oncology surgery. This booklet will help guide you through the sequence of events and provide you with information to answer common questions you may have.

We will be using a program called Enhanced Recovery to help plan your surgery. By using an Enhanced Recovery Program we can help you to recover faster. To find out more about Enhanced Recovery and your role, please check on the link below to watch a 5 minute video:

http://www.youtube.com/watch?v=swXJ_7Gtqz4
if the link fails, please copy and paste directly into Google Chrome to obtain the video)

Having a surgery can be a stressful event. We hope this booklet will help you understand your surgery, decrease some of the stress, and give you information to help speed up your recovery.

**Please bring this booklet with you to your Pre-Admission Clinic appointment and to the hospital when you come in for surgery. We will be using your booklet to help with your teaching and track what questions/concerns you might have.**

There is space throughout the booklet to write down any questions that come to mind. Use this space as well to write down the answers to your questions. We will go through the information with you and give you instructions that are specific for you.

In the hospital, you could hear words you are not familiar with. At the back of the booklet is a section for you to keep track of words you would like explained. If you hear words that you do not understand, please write them down and ask us to explain the words to you.

You are an important member of your care team. **You will benefit from taking an active part in preparing for your surgery and your recovery.** Your care team is here to help you and your family through your surgery. If you have any questions or concerns, please feel free to discuss with any of us.

Please feel free to ask any health care provider to wash their hands.
Gynecologic Surgery – A Quick Review

The female reproductive organs are located in the abdomen (stomach).

The female reproductive organs include: vagina, cervix, uterus, ovaries and fallopian tubes.

While lymph nodes (small bean shaped masses) are not part of the reproductive system, they are located near them. Lymph nodes act as a filter to remove things like bacteria, viruses and cancer cells.

Female Reproductive System

![Female Reproductive System Diagram](image-url)
There are many different gynecologic oncology surgery procedures that can be performed by your surgeon. They are:

- **Vagina Hysterectomy**: removal of the uterus through the vagina.
- **Total Abdominal Hysterectomy with Salpingo-Oophorectomy**: removal of the uterus, ovaries and fallopian tubes.
- **Radical Hysterectomy with Lymphadenectomy**: is the same procedure as total abdominal hysterectomy and also involves the remove of the upper part of the vagina and some lymph nodes.
- **Pelvic Mass Excision**: removal of a mass from your abdomen.
- **Tumour Debulking and Staging**: removal of bulky tumours with the ability to send tissues to pathology for staging of your disease.

Your Surgery can be done in one of two ways:

1. In **laparoscopic surgery**, several small cuts or incision are made on the belly through which instruments and a camera are inserted.
2. In **open surgery**, the surgeon makes a single large incision on your belly.

Your Surgeon discusses with you about which way will be best for you.
Before Your Surgery

Telephone Teaching Session
If the pre-admission anesthesiologist determines you are well, you will have a telephone teaching session with a pre-admission nurse. The nurse will help guide you through the process of your surgery, go over what you need to do to get ready for surgery, and answer any questions you have.

Pre-Admission Clinic
You may be asked to visit the Pre-Admission Clinic before surgery depending on your health history.

You meet with an anesthesiologist (the doctor who gives you the medicine you need to sleep through the surgery) and a nurse. Together they will help guide you through the process of your surgery, go over what you need to do to get ready for surgery, and answer any questions you have.

Since we give you a lot of information during this visit, **we encourage you to bring a family member or friend with you.**

During this visit or telephone teaching session:
- We ask you questions about your health and medical history. This information helps us plan your care. We also start planning for when you go home after surgery.
- We tell you which medicines you are to take or stop taking before the surgery. If you are not sure, ask us.
- We review what you need to do to prepare for the surgery.

What to bring to this appointment:
- All the medicine, supplements and herbal products you are taking in their original containers
- A summary of your medical history and your health problems
- **This booklet**
Getting yourself ready

It is important for you to be in the best possible condition for your surgery. This will help you recover faster and decrease the chances of any problems. The recommendations below are things you can do to help prepare yourself for surgery.

1. Move

Exercise helps you be in the best shape possible before your surgery and can help speed up your recovery. You do not need to join a gym. Just going for a walk for 30 minutes each day is good exercise. Talk to your doctor before starting an exercise plan.

2. Breathe

a) Deep breathing opens up your lungs, exercises the lung muscles and improves oxygen delivery to your body.

Deep breathing exercise: Do every hour while you are awake

• Start by placing your hands on your ribs
• Take a deep breath slowly through your nose, expanding your lower chest until you feel your ribs push against your hands
• Hold your breath for a count of 3
• Breathe out slowly through your mouth
• Repeat this 5 more times

b) Smoking and Tobacco Use

Research tells us that people who stop smoking at least 1 month before surgery have fewer complications after surgery.

a. For free nicotine patches, gum, lozenges, or inhaler:
   Visit your local pharmacy. You do not need a prescription but you will need to sign a declaration form.

b. For smoking cessation prescription drugs: Ask your doctor for your options.

c. For more information visit website: www.gov.bc.ca/bcsmokingcessation

d. For Smoking Cessation Counselling: 604-875-4800 (select option 2)
3. Eat

a) Your body will need extra energy, nutrients, and calories to heal. It is important that you be in the best nutritional shape that you can be. A dietitian can help you choose healthy foods that will help prepare you for surgery. If you have had unexplained weight loss or gain in the past 6 weeks, if you have noticed a decrease in appetite, or if you are overweight or underweight, it may be helpful to speak with a dietitian. You can get a referral to a dietitian from your family doctor or you can contact a dietitian by dialing 8-1-1 (Health Link BC) on your phone. Be sure to tell them you are going for surgery.

b) Alcohol
Alcohol can interfere with your anesthetic and other medicines we give you during and after surgery. Do not drink any alcohol for at least 48 hours before your surgery.

4. Relax
It is very normal to feel anxious before surgery. We also know that stress increases the release of hormones that can delay healing and recovery. Get moving, practice breathing exercises and dedicate time to positive things can help improve your outcomes after surgery.

5. Anemia management and iron stores
Anemia occurs when your red blood cell count (hemoglobin) is low. This impairs your body’s ability to adequately deliver oxygen to tissues. Anemia is commonly caused by bleeding or low iron stores. Anemia is the greatest risk factor for needing a blood transfusion during surgery. Both anemia and blood transfusions are associated with a greater risk of complications in hospital. Improving your hemoglobin will also allow you to heal better, and have more energy when you return home. If your hemoglobin or iron stores are low, you may be contacted by the Perioperative Blood Management Program (PBMP) with suggestions to help improve your hemoglobin and iron stores.

6. Blood Sugar Control
Your blood sugar will be checked with a blood test called HgA1C. If the result is high, you may be referred to an endocrinologist (diabetes doctor) to improve your blood sugars before surgery. Maintaining normal blood sugar is important for wound healing, especially after surgery.
Planning now for when you go home

You are admitted to the hospital on the morning of your surgery.

You can expect to go home 1 to 3 days after your surgery, but this varies with each person depending on the type of surgery you are having and your health. Most people are ready to go home at 10:00 in the morning. Please arrange for a ride home.

Before you come to the hospital, think about what you will need when you go home (or wherever you will be staying). Get things ready in advance so they are ready when you leave the hospital. You will need help with meals, laundry, bathing, etc for the first week or so. Try and arrange for family and friends to help you. If you need help with wound care or other care, we will arrange this before you leave the hospital.

Something to organize and to prepare for a successful recovery:

- Where will you be going after you leave the hospital?
- Will you go home or stay with family or friends for a while?
- Who will drive you home from the hospital?
- Prepare and freeze meals ahead of time so all you have to do is microwave or reheat.
- Shop for extra food that is easy to prepare.

Fair PharmaCare Plan

We encourage all British Columbians with Medical Services Plan (MSP) coverage to register for Fair PharmaCare. Coverage under this plan is based on family net income. It is available to single people or to families. You may be eligible to get your discharge prescription medicines at reduced cost with Fair PharmaCare Plan. Ensure you have registered for Fair PharmaCare before your surgery at this link:

https://www2.gov.bc.ca/gov/content/health/health-drug-coverage/pharmacare-for-bc-residents/who-we-cover/fair-pharmacare-plan
What to bring to the hospital?

- **Bring this booklet with you.** We refer to information in this booklet throughout your stay.

Pack a small bag with things you could need during your hospital stay.

- **Sugar-free chewing gum for after surgery**
- Your BC CareCard and private insurance information
- Your Driver’s License or other government issued identification
- If you do not speak English, bring someone to assist you. If you need an interpreter, please advise your surgeon before your hospital admission.
- All your medicines in original containers (including non-prescription medicines)
  - **DO NOT** bring your narcotics to the hospital
- Housecoat, slippers with non-slip soles, pyjamas
- Toothbrush, toothpaste, soap, deodorant, shaving equipment, earplugs
- Clothes to wear on the day of going home
- Glasses (in the case with your name on it)
- Dentures and container labelled with your name
- Hearing aids and spare batteries (with the container labelled with your name)
- Mobility aids you normally use (cane, walker)

**Please limit belongings to 1 small bag.**

The hospital is not responsible for lost or stolen valuables. Please leave any valuables at home.
Special Preparations

We have specific instructions for you on how to prepare for the surgery depending on what type of surgery you are having. Your surgeon might also give you other specific instructions.

We have checked off (✓) in this section which instructions you are to follow. Follow these instructions along with what your surgeon has given you.

The week before your surgery

Medicines

• **DO NOT** take any non-prescription vitamins, supplements, herbal medications or herbal tea for 7 days before your surgery.

• Follow the instructions from the anesthesiologist or nurse in the Pre-Admission clinic.

The day before surgery

Surgery Time

• Your surgeon’s office calls you to tell you what time you are having your surgery and what time you need to check into the hospital.

• Write this time on the inside cover of this booklet.

• If you have not heard from the office by 2:00 PM, call the surgeon’s office to get this information.

Contact your surgeon’s office as soon as possible if:

• You feel sick

• You have become pregnant

• For any reason you feel you need to cancel your surgery
The day before surgery, continued

Diet

- STOP eating solid food at midnight

**After midnight up to 1 hour before hospital check-in time:**
- You may drink ONLY water, clear apple juice or clear cranberry juice
- **Do NOT** drink citrus juices, carbonated drinks or dairy products

Carbohydrate loading for Non-Diabetic and Diabetics **NOT** on insulin

- The evening before surgery prior to midnight:
  - Drink clear fluids high in sugar (carbohydrate).
  - This helps to keep you hydrated and helps keep your blood sugar normalized during surgery. Do not use diet or sugar-free drinks.

Examples of drinks:

- PREcovery 400 mL
- Apple juice 500 mL = 2 cups
- Cranberry juice 500 mL = 2 cups

Drink at least the amount shown. Drinking more is okay.

Carbohydrate loading for Diabetics **on insulin**

- You are not required to drink a clear juice unless you feel hypoglycemic. You may continue to drink water to remain hydrated.
The day of your surgery

Medicines

The Pre-Admission Clinic Anesthesiologist or nurse will tell you what medicines to take on the day of surgery. You can take these medicines in the morning with a small sip of water.

Carbohydrate loading for Non-Diabetic and Diabetics NOT on insulin

1 hour before your check-in time at the hospital, drink 400 mL PREcovery or 250 mL (1 cup) of the juices/tea as listed on previous page. Stop drinking all fluids once you have finished this drink. DO NOT drink this sugared drink if you have been told not to drink or eat after midnight.

Carbohydrate loading for Diabetics on insulin

1 hour before your check-in time at the hospital, drink 250 mL (1 cup) of water. You may drink a clear juice instead (up to 250 mL) if you feel hypoglycemic.

At the hospital

- Go directly to the Admitting Department. You will be given directions on where to go.
- We check you in and make sure all your preparations are complete.
- If you need your glasses, leave them on until we ask you to take them off.
- Keep your hearing aid(s) or cochlear implant in place until we ask you to take it off.
- Leave your dentures in until we ask you to take them out.
- We might give you some medicines to help prepare you for your surgery.
- We encourage you to leave your bag of clothes and other belongings with family.
The Surgery

We take you into the operating room about an hour before your surgery.

You meet with the anesthesiologist who will take care of you while you sleep through the surgery.

We insert an intravenous (IV) into your arm.

**General Anesthesia:** The anesthesiologist gives you anesthetic drugs through your intravenous to help you sleep and manage pain during surgery. We also place a mask over your mouth and nose to give you oxygen and possibly other drugs to help with your breathing.

Waiting room

Your family or friends can wait for you in the waiting room.

Your visitors will not be able to see you until you have been moved to the nursing unit. We let you and your family know which unit you are going to.
After Surgery

Post-Anesthetic Care Unit

When your surgery is finished, we move you to the Post-Anesthetic Care Unit (PACU), often called the ‘recovery room’.

You wake up in the recovery room, although you may be drowsy. When you are able, we get you to put your hearing aid(s) or cochlear implant on. You can have your glasses at any time.

You will have an oxygen mask and at least one intravenous. You will have a catheter in your bladder to drain urine depending on your surgical procedure.

We check your blood pressure, pulse, and breathing rate frequently. We also check the bandage (or dressing) covering your surgery area as well as your peripad. We ask you how much pain you are having and give you pain medicine when needed.

You can begin to do your leg exercises. You can also begin to chew gum.

When you are well enough to be cared for on our surgical nursing unit, we move you to that unit. Your family and friends can visit once you are on the unit.

Surgical Nursing Unit

You stay on this unit until you are ready to leave the hospital. Our goals are to control your pain, prevent complications, increase your activity, and return you to your normal diet. Most people will stay on the unit for 1 to 3 days, but this varies with each person depending on the type of surgery you had and your health. The team will keep you informed of your progress and anticipated discharge date.
Pain control

Many people are concerned about pain after their surgery. Some people feel pain is expected and try to “grin and bear it” while others do not want to take pain medicine because they are afraid of becoming addicted. When you take opioid medicine (eg. hydromorphone, oxycodone, morphine) for acute pain, such as the pain that happens after operations or accidents, the risk of addiction is low.

Adequate pain control is important to your recovery. Having your pain under control allows you to:

- breath deeply to prevent lung infections
- move to prevent blood clots
- sleep well
- eat better for wound healing
- recover faster

We give you several different pain medicines regularly. This helps give you better overall pain relief. You will receive these pain medicines even if you are not in pain at the time. If you are asleep, the nurse will wake you to take these regular medicines.

- You will get regular acetaminophen (Tylenol®) every 4 to 6 hours throughout your stay
- You may get NSAIDS such as naproxen (Voltaren®) every 12 hours throughout your stay.
- You may have a pain pump for you to give yourself pain medicine, such as a Patient-Controlled Analgesia (PCA) Pump.
- You will get other pain medicines as needed

Non medicine therapy you can do to help ease the pain:

- listening to music
- doing slow and relaxed breathing
- heat or cold compresses
- positioning
- imagining peaceful situations

Your pain score

An important part of managing pain is monitoring how much pain you are having. The best way to monitor your pain over time is to use something to measure the amount of pain you have.
Pain control, continued

To help us assess your pain and the effectiveness of the pain medicine, we use a pain rating scale. We will ask you to rate your pain on a scale of 0 – 10, where 0 means no pain at all and 10 is the worst pain ever.

Where we want your pain level to be:

- At a level less than 4 on the number scale, or
- At a comfort level that allows you to carry out your normal activities such as washing up, sitting and walking

Pain medicine works best if it is taken BEFORE pain becomes uncomfortable.

It is important to know that pain medicine will not make your recovery completely painless. The goal is to manage your pain and help you recover.

Let your nurse know if your pain does not get better with pain medicine or is getting worse.

Nausea and vomiting

You might feel sick to your stomach (nauseated) or throw up (vomit) after surgery. You will get medicine to prevent nausea every 8 hours for the first day, and then as needed. Let your nurses know as soon as you feel sick to your stomach so we can give you medicine right away and prevent it from getting worse. These medicines work best if you take them before the nausea gets uncomfortable.

Other ways to help settle your stomach:

- Place a cool damp cloth on your face.
- Take some slow deep breaths.
- Take small sips of cold water or suck on ice chips.
- Try distracting yourself with music or watch TV.
Eating, drinking, and digestion

After surgery, your body needs healthy foods with extra calories and protein to help you heal. It is normal for your bowels to move slower than normal after surgery.

Drinking and eating as soon as you can after surgery helps your bowels return to working normally. The nurses may be providing you with a high protein drink (eg. Boost®) to supplement your diet.

We ask you often if you are passing any gas out of your backside (anus). This is a sign your bowels are starting to ‘wake up’ after the surgery.

- Chewing sugar-free gum helps wake up your bowel faster. It can also help keep your mouth moist.
- You should chew gum for up to 15 minutes 3 times a day.
- Do not swallow the gum.
- Drinking coffee may also help wake up your bowels faster.

The stress of surgery can cause high blood sugars. Your blood sugar will be tested several times after surgery. Some patients need insulin to lower their blood sugar right after surgery.

Activity

The sooner you can get up and move around, the better it is for your recovery. Lying in bed leads to muscle weakness and can cause blood clots and pneumonia. Activity increases strength, helps to prevent complications, and helps get your bowels moving.

On the day of your surgery, your nurse or physiotherapist gets you up into a chair next to your bed. Remember to do your leg exercises (see page 23) when you are in bed.

When you start to eat, you will sit up in the chair for all your meals.

As you improve each day, you will be able to do more for yourself. Keep your activities short and do them often rather than try to do everything at once. We don’t want you to get too tired.

We will encourage you to get up and walk around the unit as soon as you can. Most people are up and walking the day after surgery.
Deep breathing and coughing/ICOUGH Protocol

After surgery, your lungs make extra mucus. Deep breathing and coughing exercises help to clear this mucus from your lungs and prevent pneumonia. Deep breathing opens up your lungs and helps to loosen the mucus. Coughing helps remove the mucus from your lungs.

Before doing these exercises, make sure your pain score is at a level that allows you to do these exercises. If needed, ask for pain medicine at least 1 hour before doing these exercises.

Deep Breathing Exercise
Do every hour while you are awake.

1. Start by placing your hands on your ribs.
2. Take a deep breath slowly **in through your nose**, expanding your lower chest until you feel your ribs push against your hands.
3. Hold your breath for a count of 3.
4. Breathe **out slowly through your mouth**.
5. Repeat this 5 more times.

Coughing Exercise
Do every hour while you are awake and after your deep breathing exercise.

1. Place a small pillow or blanket over your surgery area to protect or splint your incision. This helps decrease pain with coughing and allows a stronger cough.
2. Take a faster deep breath **IN** and cough. Get rid of that mucus!
3. Take a 30 second break. Repeat 2 more times.
Moving around in bed

Change your position in bed at least every 2 hours. This helps keep you from getting stiff and gets blood flowing to your arms, legs, and skin. You might find moving difficult because of incision pain.

**To move your body sideways:**
1. Lie on your back.
2. Bend your knees.
3. Lift your hips and shift them sideways.
4. Then follow with your shoulders.

**To roll onto your side:**
1. Bend your knees.
2. Support your incision with one hand (the hand on the side you are rolling onto).
3. With the other hand, reach across to the bed side-rail.
4. Pull yourself onto your side, rolling like a log.

**To sit up on the side of the bed:**
1. Bend the knee on the side you are not turning onto.
2. Use your bent leg to help you log roll onto your side. Roll your whole body as one as much as possible.
3. Drop your legs over the edge of the bed.
4. Push yourself up with your arms.

If you cannot remember how to do these exercises when you are in the hospital, don’t worry. Your physiotherapist or nurse can review with you how to do all of these exercises. To help you remember to change positions, we remind you.
Leg Exercises

Exercises help keep the blood flowing through your legs, keep your muscles strong, and prevent stiff joints. Exercises reduce the chances of you getting a blood clot.

Do all of these exercises *every hour* while you are awake until you can get up and walk around the nursing unit.

Ankle Pumps
1. Bend your foot up towards your head.
2. Bend your foot down towards the foot of the bed.
3. Repeat 5 times.

Ankle Circles
1. Move your feet around slowly in large circles.
2. Repeat 5 times in each direction.

Hip Flexion
1. Bend your knee by sliding your heel up toward your body as shown.
2. Slide your heel back down.
3. Repeat 5 times.

Thigh Muscle Contraction
1. With your leg straight, tighten the muscles on the top of your thigh.
2. Press the back of your knee down.
3. Hold for 5 seconds. Relax.
4. Repeat 5 times then repeat this exercise with the other leg.
**Blood Clots**

Hospital patients are at risk of having a blood clot form in the leg veins. This is called a **Deep Venous Thrombosis** (DVT). Sometimes, the clot can break off and “travel” to the lungs, causing a **Pulmonary Embolism** (PE) which can make breathing difficult. Although it is rare, PE can be fatal.

**Risk Factors for Blood Clots after Your Hospital Stay**

The higher risk of DVT and PE persists for at least the first month after you go home from the hospital. The risk is particularly high if you:

- Just had surgery for cancer
- Have had previous DVT or PE
- Spend more than half the day in bed or sitting (when you were able to walk around before being hospitalized).
- Taking hormone drugs or chemotherapy

If your risk of DVT/PE remains high after you go home from hospital, your doctor may prescribe an anticoagulant (sometimes called a blood thinner) for you to take at home to lower your risk.

**Signs and Symptoms of Blood Clots**

It is important that you recognize the signs and symptoms of DVT and PE.

If you have DVT, you may experience any of these:

- Swelling, throbbing, cramping or redness in a leg or calf
- Pain in your leg when you stand or walk

If you have PE, you may experience any of these:

- Sudden shortness of breath that you can’t explain
- Sudden chest pain that feels sharp or gets worse when you take a deep breath
- Coughing up blood
- Heart palpitations or racing, especially if you also feel light-headed or faint
How Can You Reduce Your Risk of Blood Clots?

Effective ways to reduce your risk of DVT/PE:

- Take the anticoagulant if it is prescribed by your doctor.
- Walk and remain as active as possible as instructed by your doctor.
- Go to http://www.healthlinkbc.ca/healthguide.stm for information on leg exercises that you can do.
- Avoid getting dehydrated by drinking enough water and limiting alcohol intake.
- Some medications can increase the risk of DVT or PE, such as birth control pills or hormone replacement therapy. Speak with your doctor to find out if you should stop taking these.
What to Expect Each Day

Every person’s recovery is different. These next pages describe what most people can expect following gynecologic oncology surgery.

Most people are ready to go home in 1 to 3 days after surgery. We use the guidelines below to help us decide when you are ready to go home. You are ready to go home when you meet the 5 criteria below:

- Your pain is managed with pills only
- You are able to eat food without pain or bloating
- You are passing gas or have had a bowel movement
- You are able to do your basic activities of daily living
- There are no signs of problems from your surgery

<tr>
<td>How will I feel?</td>
<td>You probably feel sleepy and need to rest.</td>
</tr>
<tr>
<td>What equipment do I have?</td>
<td>You might have several pieces of equipment and tubes. These are different for everybody but can include:</td>
</tr>
<tr>
<td></td>
<td>- Oxygen mask</td>
</tr>
<tr>
<td></td>
<td>- Intravenous for fluids</td>
</tr>
<tr>
<td></td>
<td>- Patient-Controlled Analgesia (PCA) Pump for pain control</td>
</tr>
<tr>
<td></td>
<td>- Catheter into your bladder to empty your bladder and measure the amount of urine (pee)</td>
</tr>
<tr>
<td></td>
<td>- Dressing or bandage over your incision(s)</td>
</tr>
<tr>
<td></td>
<td>- Peripad to absorb vaginal flow</td>
</tr>
</tbody>
</table>
### Surgery Day, continued

#### How is my pain treated?

If your pain score is more than 4 out of 10 on the pain scale, tell your nurse.

We will ask you for your pain score at least every 4 hours.

We treat your pain several ways:
- Patient-Controlled Analgesia (PCA) Pump
- Regular acetaminophen (Plain Tylenol®) every 4 to 6 hours
- Non-Steroidal Anti-inflammatory medicines such as diclofenac (Voltaren®) every 12 hours.
- Other pain medicines

Relaxation techniques such as deep breathing, warm blankets, or listening to music.

#### What is my activity?

With help, you will get up to a chair or sit on the edge of the bed for a minimum of 15 minutes.

Every hour while awake:
- Deep breathing and coughing
- Leg exercises when in bed

Sit up for all meals

#### What can I eat?

You can drink any hot or cold liquids.

You will be able to start eating solid foods.

You may be asked to drink 1 oral nutrition supplement drink today.

We encourage you to chew gum for up to 15 minutes, 3 times a day.

Tell the nurse if you pass gas or have a bowel movement.

You will receive nausea medicine every 8 hours to prevent nausea.

Your blood sugar will be tested regularly.

#### Can I wash?

We may help you wash in the evening

#### Can I have visitors?

You can have visitors but remember you will be tired. Keep visits short. We suggest only close family visit you today.

Day 3 until you leave the hospital, continued

When can I go home?

You may be going home today or, plan to go home on day __________.

Review The Day You Go Home, on page 32 of this booklet to help get ready for discharge.

Review your Pain Control After Surgery: Patient Information booklet.

Continue to learn how to self-inject LMWH.

Before you leave, if you still have questions, take time to ask us.

The Day You Go Home

How you know you are ready

Everybody recovers at a different pace depending on their general health, any existing health conditions, and the type of surgery.

Generally, you are ready to leave the hospital when:

- Your blood tests are normal or close to normal
- Your blood pressure, heart rate, and temperature are normal for you
- Your incision is healing
- Your abdomen is soft and not bloated
- You have bowel activity (passing gas or having bowel movements)
- You are able to control your pain with just pain pills
- You are eating well enough
- You are able to walk around the unit and do most activities you could do before you had your surgery
- You can look after yourself at home (with help if needed)
- You can self-inject your LMWH

Your ride home

Most people are ready to go home at 10:00 a.m.

Ask the person picking you up to come and get you from the unit.

If you cannot get picked up by 10:00 a.m., we may ask you to wait in the Patient Lounge. We do this so that we can get your bed cleaned and ready for the next patient.

If there is a problem getting a ride or getting home, you might need to stay in a local hotel for 1 or 2 nights. You cannot continue to stay in the hospital if we feel you are well enough to leave the hospital.
Before you leave

Make sure you have:

• All your personal belongings including any medicines you brought with you
• Your house keys
• Your prescriptions
• Instruction sheet for any new medicines
• Your information booklets
  - ERAS Gynecologic Oncology Surgery
  - Pain Control After Surgery: Patient Information
• Found out where and when you are to get your staples removed
• Talked with an occupational therapist if you need equipment at home
• Asked your surgeon when you need to make a follow-up appointment
• Someone to stay with you for the first few days at home in case you need help

Follow-up visit

Make follow-up appointment as directed by your physicians within a few days of returning home, or once you have received your pathology results. Your surgeon will call with results at approximately day 10 post operatively. If you have NOT heard by 2 weeks post operatively, please call your surgeons office and request a call back with results.

If you have having problems once you are discharged, please call your surgeon’s office to speak with them or their on call colleague. If more urgent care is needed, it is generally preferable to return to the hospital where your surgery took place (VGH Emergency Department for surgeries performed at both VGH and UBCH).

At the follow-up appointment, your surgeon reviews how you are recovering, talks with you about any test results from your surgery, and tells you if you need any further treatment.

If you are admitted to a different hospital related to a surgical complication, we would like to ask that a family member notify your surgeon’s office.
Caring for Yourself at Home

It can take 6 to 8 weeks to recover from gynecologic oncology surgery. Even when you are ‘healed’, it can still be several months before you feel completely recovered. There are some things you can do to help your recovery.

Pain

When you are discharged home, it is normal to have some abdominal pain for the first few weeks. Adequate pain control can help in your recovery so you can participate in physiotherapy and resume your regular activities. The goal is to take the least amount of medication, which will limit the side effects you may experience.

How to manage pain:

Remember to take your pain medication before activity or bedtime.
1. Use a pillow for support when you do your deep breathing and coughing exercises.
2. Try non medicine therapy such as: heat or cold compresses, positioning, guided imagery, listening to music.
3. First try regular acetaminophen (Plain Tylenol ®).
4. If Tylenol® alone is not enough to ease your pain, take ibuprofen (Advil®, Motrin ®) or another non-steroidal anti-inflammatory medicine.
5. If you’ve been prescribed opioid pain medicine (eg. hydromorphone, oxycodone, morphine), take this medicine if the Tylenol® and ibuprofen does not help.

Opioid pain medicine

They are sometimes called “narcotics.”

Commonly prescribed opioids include:

- Codeine: Tylenol 3
- Morphine: M-Eslon, MS Contin
- Tramacet/Tramadol
- Oxycodone: Percocet
- Hydromorphone: Dilaudid
Information on opioid pain medicine

Can I get addicted to morphine-like medicines?

When you take opioid medicine for acute pain, such as the pain that happens after operations or accidents, the risk of addiction is low.

Taking opioid medication for an extended time can lead to dependence.

It is important to taper off opioid medication as your pain improves.

What are the side effects of opioid pain medicine?

- Sleepiness
  ***Do NOT drive, use power tools, or operate machinery while taking opioids. **It is against the law to drive while taking opioids***
- Confusion
- Nausea
- Vomiting
- Constipation
- Itchiness
- Inability to urinate
- Slowed breathing

When do I start tapering off opioid medicine?

When the surgical pain becomes manageable, you should start to reduce how much opioids you take.

How do I taper off opioid medicine?

1. Reduce how much you are taking (the number of pills you take).
   For example: If you were taking 2 pills each time, start taking 1 pill to see if the pain is controlled. If it does, continue with 1 pill each time. Do this for 1–2 days.

2. Then reduce how often you are taking the medicine.
   For example: If you are taking a dose every 4 hours, then take a dose every 6 hours instead for 1–2 days. Then take a dose every 8 hours for 1–2 days. Then consider stopping.
Can I go through withdrawal?

Withdrawal symptoms are a sign that your body is used to taking opioids regularly and that you need to reduce the opioids more slowly.

Withdrawal symptoms are:

- Sweating
- Fever
- Nausea
- Vomiting
- Feeling agitated or irritable

How do I store opioid medicine?

These medicines should be kept out of sight and ideally in a hidden or locked area. Make sure you keep your opioid medications safely out of reach of children and the elderly as taking these can cause harm to them.

How do I dispose of extra opioid medicine?

If you have unused opioids, most pharmacies in British Columbia have a drug return program where they will properly dispose of extra medicines. Never save medicines, thinking you may use them at a later date. All medicines have expiration dates and may not be safe to take later.

Caring For Your Incision (if you have one)

Your incision is usually closed and dry after a couple of days. You usually do not need a dressing and can leave the incision open to air. If you have staples or sutures, these can catch on your clothing. If this happens, place a light dressing or covering over top.

Do not put creams or lotions onto the wound (such as Polysporin, Vitamin E) unless your surgeon tells you to.

- **Bathing:**
  
  You can take a shower but try not to let the water spray directly on your incision for more than a few seconds.
  
  For 2 weeks after your surgery, **do not soak in a bath.**
• Staple removal:

Call your family doctor to have your staples removed.

Your surgeon will tell you when to have your staples removed. If you cannot remember, call your surgeon’s office.

• Dressing or bandage changes:

If you need dressing changes, we arrange for community nursing before you leave the hospital. The community nurse checks your wound and changes your dressing.

Diet

It might take some time before your appetite returns to normal. To heal, your body will need extra calories, nutrients, and especially protein.

• Drink at least 6 to 8 glasses (1.5 to 2 L) of water each day (1 glass equals 250 mL).
• Eat foods high in protein such as chicken, beef, fish, eggs, tofu, lentils, dried peas, and beans. Dairy products such as milk, yogurt and cheese are also good sources of protein.
• Try to eat 5 or 6 small meals throughout the day rather than 3 big meals.
• If you are not able to eat enough food each day, you can continue drink 1 or 2 oral nutrition supplement drinks (e.g. Boost or Ensure) each day.

If you have questions about your diet, you can call 8-1-1 (HealthLink BC) any time and ask to speak to a dietitian.
Caring for your bowels

You might find your bowels do not work the same way they did before your surgery. It can take a few weeks for your bowels to work normally.

• Constipation
  This can be from your pain medicine, especially if you are taking opioids.
  To prevent constipation:
  - Drink at least 6 to 8 glasses (1.5 to 2 L) of water each day unless you have been told differently because of a medical condition.
  - Include fruits, vegetables, dried peas, beans, lentils and whole grains in your diet each day. These foods are high in fibre.
  - Keep active. Go for a walk every day.
  To treat constipation, talk to your pharmacist about a mild laxative or stool softener. Do not use an enema or suppository without checking with your surgeon first.

• Diarrhea
  Persistent severe diarrhea is not normal and should be brought to your surgeon’s attention.
  So you do not become dehydrated, drink 8 to 12 glasses (2 to 2.5 L) of water each day unless your doctor or dietitian has told you to limit how much you drink.
Activity and exercise

• Rest
    Rest is important for your recovery. Your body does its healing when you are resting.
    Try to get at least 8 hours of sleep each night.
    Take naps or rest breaks during the day.

• Exercise
    Exercise helps build your strength, improves your circulation, and generally makes you feel better.
    Be careful not to tire yourself out. Slowly increase your activity. Let pain be a general guide to what you do and how often you do it.

These are only general guidelines. Please confirm them with your surgeon.

• Plan your day to allow time for both rest and activity.
• Continue with your deep breathing and coughing exercises.
• Begin with taking short walks. Gradually increase how far you walk.

• For the first 4 to 6 weeks after your surgery:
  - Do not lift, push, or pull anything over 4 to 5 kg (10 pounds). This includes carrying children and groceries.
  - Do not do any activities that pull on your incision and abdominal muscles such as vacuuming, raking, painting walls, or reaching for things in high places.

• For at least 8 to 12 weeks after surgery:
  - Do not do anything that puts extra stress on your stomach muscles such as doing sit-ups.

Listen to your body. It will tell you if you are doing too much too soon.
Driving a car

Before you start driving, check with your doctor to make sure it is okay.

- Only drive if you are able to:
  - Put pressure on the brake quickly and without pain.
  - Safely do a shoulder-check.
  - Wear your seatbelt.

- You can drive if you are only taking Plain Tylenol or ibuprofen
  - Do not drive your car while you are still taking opioid pain medicine if it makes you sleepy.

Sports

About 8 to 10 weeks after your surgery and if your surgeon says it is okay, you can go back to playing any sports that do not involve contact such as golf, running, and tennis.

Ask your surgeon when it is safe for you to play contact sports such as hockey or football.

Sexual activity

Some women find that they do not have the same interest in sex as they had before surgery. This is normal and interest usually increases as you feel stronger. You can resume sexual activity when you feel you have enough strength and your pain is under control.

Going back to work

Always check with your family doctor before going back to work.

Some people return to work 6 to 8 weeks after surgery. When you go back to work depends on the type of work you do and the type of surgery you had. Sometimes it can take longer for you to recover enough to go back to work.
When to Get Help

Contact your surgeon or family doctor if:

• Your pain gets worse or does not go away with pain medicine.
• You have a fever over 38.5° C (101.3° F).
• Your incision becomes red, swollen, or hot to touch.
• You notice a lot of clear liquid or foul smelling liquid coming from your incision.
• You notice foul-smelling discharge coming from your vagina.
• You start bleeding from your incision.
• You feel sick to your stomach (nauseated) or throw up (vomit) often for more than 24 hours.
• You have diarrhea that lasts for more than 2 days.
• If you have a drain that is accidentally pulled out.

If you are not able to contact your surgeon or family doctor, go to the nearest Emergency Department, or call HealthLink BC at 8-1-1 to talk to a registered nurse. Be sure to tell them about your recent surgery.

If you have signs or symptoms of DVT or PE you should:

• Call your family doctor and request an urgent appointment, OR
• Go to the nearest Emergency Department if the family doctor’s office is closed, OR
• Call 911 immediately if you are feeling faint or short of breath.

Going Home at a Glance

Usually you are ready to leave at 10:00 a.m.
Please arrange for your ride to come just before this time.

Your Surgery: ____________________________________________________

Surgery Date: _________________________________________________

Your Surgeon: ______________________ Office phone: ______________

Follow-up Appointment: __________________________________________

Before you leave, do you:
☐ Know what to do or who to call if you have a problem?
☐ Have a prescription for your medicines (if needed)?
☐ Know how to care for your incision?
☐ Know how to manage your pain?
☐ Know how to prevent constipation?
☐ Know how to self-inject your LMWH
☐ Know about your activity levels at home?
☐ Have all your personal belongings?

If you have staples or stitches, you need to have these taken out by your family doctor unless you are told otherwise.
